Dark-state truth and best sink-free Duhamel-transport fit
Truth: $k_d = 0.01$**; joint transport fit:** $J_{12} = 0.02689$, $k_{12} = 0.008798$, $\gamma_\phi = 0.02383$

Truth is the full RP+NRP response of the terminal-sink model. The candidate has no dark state. A rank-reduced reference pathway basis is weighted to preserve the full canonical sum at the reference; transport is third-order Duhamel/autodiff. All panels share a single truth-derived L2 normalization.
