Spectral sensitivity atlas
Dimer control point; $t_2 = 1$; 21 × 21 dense model-evaluated pixels; complex response retained

Coordinate steps use $s_i\,\partial S/\partial\lambda_i$, with scales $s = (0.05\ \textit{energy}, 0.015\ \textit{rate}, 0.025\ \textit{rate})$. Frequency pixels are shown as recorded; the dense map is a forward-model evaluation, not an experimental sampling resolution.
